

BACSWN Data Governance Sovereignty

BACSWN — Data Governance & Sovereignty Policy

Document: BACSWN-GOV-2026-005 **Classification:** CONFIDENTIAL — For Authorized Recipients Only **Prepared for:** Owner & CEO, BACSWN (private delivery partner) / Ministry of Transport & Aviation **Prepared by:** Sky Miles Limited — AI Elevate Division **Version:** 1.1 — June 2026 **Companion to:** Mesh Architecture Master Plan (BACSWN-MARCH-2026-002, esp. §4.4 cryptography and §8 integration) **Change log:** v1.1 adds the trusted AI supply-chain clause (no Chinese-built models) in §6.

1. Purpose & Principle

BACSWN generates and exchanges data that is operationally sensitive (airspace, military tracks) and nationally important (weather, emergency, aviation revenue). This policy defines who owns it, where it lives, how long it is kept, and the rules for sharing it — especially across police, defence, and foreign (U.S./ICAO) boundaries.

Founding principle — Bahamian data sovereignty. All BACSWN operational data is the property of the **Commonwealth of The Bahamas**. The delivery partner operates the system and is a **data processor / custodian**, not the owner. Cross-border sharing is **bilateral, least-privilege, and revocable**, and never transfers ownership.

2. Data Classification

Class	Examples	Handling
Public	Public weather, SIGMETs, hurricane advisories	Freely publishable through official channels
Operational	METAR/observations, commercial flight tracks, sensor/mesh telemetry	Internal + authorized agencies; encrypted in transit/at rest
Restricted	Overflight/landing-fee records, emergency-response coordination, shelter occupancy	Need-to-know; agency-scoped access; full audit
Sensitive / National-Security	Military / non-cooperative tracks, defence data-share feeds	Strict least-privilege; defence-grade handling; segregated; access logged and reviewed

Personal data (e.g., any identifiable evacuee/shelter records) is minimized, access-controlled, and governed by Bahamian data-protection law (§6).

3. Data Residency & Sovereignty

- Primary residency:** BACSWN data resides on **Bahamian-controlled infrastructure** (primary hub + off-island standby under national control — Architecture §4.5).
- Any cloud/standby region used for resilience operates under contractual terms that preserve national ownership, access control, and the right to repatriate/delete.
- No foreign sole-custody:** no class of national-security data is held solely on foreign infrastructure.

4. Retention, Archival & Disposal

- Retention schedule by class:** operational telemetry (rolling + archived for verification/training), fee records (retained per audit/revenue requirements), emergency/incident records (retained per NEMA and legal requirements), security/audit logs (long-retention, tamper-evident).
- Archival:** encrypted, off-island backups with point-in-time recovery (ties to O&M §7 / Architecture §4.5).
- Secure disposal:** cryptographic erasure at end of retention; decommissioned nodes have keys/data zeroized (Architecture §4.4.1 tamper-zeroization).

5. Access Control & Sharing

- **Least-privilege RBAC**, MFA, and full audit on every operator and agency interface (Architecture §4.4.6).
- **Inter-agency sharing (NEMA, Police, Fire/Rescue, RBDF/Coast Guard)**: scoped to each agency's role via the Common Operating Picture and CAP/EDXL; sensitive military tracks shared only with cleared recipients.
- **International sharing (ICAO OPMET/WAFS; future U.S. — NOAA/NHC, FAA Miami Oceanic, NORAD)**: governed by **bilateral agreements / MOUs** specifying exactly which data classes flow, in which direction, for what purpose; **revocable**, time-bounded, and logged. Defence data-sharing carries its own clearance.
- All sharing inherits the §4.4 cryptographic controls (mutual TLS, signed envelopes); no plaintext cross-boundary path.

6. Compliance & Privacy

- **Bahamian Data Protection Act** for any personal data; data minimization by default.
- **ICAO/WMO** data-exchange and security guidance for aviation/meteorological data.
- Alignment with the security standards in Architecture §4.4.9 (**FIPS 140-3, NIST SP 800-53, IEC 62443**).
- **Trusted AI supply chain**: all AI/ML models used anywhere in BACSWN (the edge 2-of-3 ensemble and any hub-side models) must be from **trusted, non-Chinese sources** — no Chinese-built model weights or training pipelines — with **documented provenance and integrity verification**. This protects national-security data and aligns with US/allied (FAA/NORAD) interoperability.

7. Roles & Responsibilities

Role	Responsibility
Data Owner	Commonwealth of The Bahamas (Ministry of Transport & Aviation) — sets policy, authorizes sharing
Data Custodian / Processor	BACSWN delivery partner — operates, protects, and audits per this policy
Data Stewards	Named leads per domain (weather, surveillance/fees, emergency, security)
Agency recipients	NEMA, Police, Fire/Rescue, RBDF — accountable for data received under their scope

8. Incident, Breach & Audit

- **Breach response**: detection → containment → notification to the Data Owner and affected agencies → remediation, within defined timelines; tied to the SecOps incident-response process (O&M §7).
- **Audit**: immutable audit logs; periodic governance review; access recertification.
- **Change control**: any change to sharing scope (especially national-security or cross-border) requires Data Owner approval.
